Contract Accounts

Purpose

This component enables you to create and manage contract account master data. In **Contract Accounts Receivable and Payable**, each business partner posting is assigned to one business partner and to one contract account. In the contract account master record, you can define, for each business partner, the procedures that apply when posting and processing the line items of a given contract account. These include, for example, payment and dunning.

Integration

Master data can be changed automatically by certain business transactions. In this way, for example, a return can result in a processing lock being set.

Features

You can assign more than one contract account to a given business partner. Similarly, a single contract account can be assigned to more than one business partner. Note however, that in the industry components listed below, different rules apply. You can transfer data manually or automatically. Contract accounts tend to be managed on an open item basis. See [Open Item Management](#). The system logs changes to master data. See [Logging Changes](#).

Telecommunications(IS-T) component

In this component, a contract account can be assigned to one business partner only.

Utilities Industry (IS-U)Component

In **Utilities**, one contract account contains all those contracts belonging to one business partner for which the same payment and dunning terms apply. You assign your business partner contracts to the contract accounts. Although one contract account can contain more than one contract, each individual contract is assigned to one contract account only. This does not apply to one-time accounts.

For more information on contracts, see the **Utility/Disposal Contracts** section in the **Utilities Industry** component.

Insurance(FS-CD) Industry Component

You assign contracts to the contract accounts for which there is a business partner. Each contract is only assigned to one contract account, however one contract account may have several contracts assigned to it.

Contract account master data is usually created and changed from the operational system using an interface.

Industry ComponentPublic Sector Contract Accounts Receivable and Payable(PSCD)

You set up the contract accounts of a business partner for the relevant taxes (property tax, income tax, and so on). You assign contract objects to a contract account for which relevant taxes are levied. If different taxes are levied for a contract object, you can make assignments to several contract accounts.

Contract Account Category

Definition

A contract account category defines certain attributes for a contract account.

Use

You have to assign a contract account category to each contract account when you create it. The fields that appear when you create a contract account are among the things controlled by the contract account category.

Structure

The contract account category determines the following contract account attributes:

- Whether you are allowed to assign only one business partner or more than one to a contract account
- Whether you are allowed to assign only one contract or more than one
- Whether you are allowed to maintain a contract account online
- The number range that is allowed for external or internal number assignment
- Whether it is a collective bill account (industry component [Utilities](#))
- Whether it is a one-time account
- Whether it is a deposit account and the account contains deposit contracts (industry component [Insurance](#))
- The editing screens or data fields that you can use to edit the contract account

Contract Account

Definition

Structure used to bill the posting data for contracts or contract items for which the same collection/disbursement agreements apply.

Contract accounts are managed on an open item basis within [Contract Accounts Receivable and Payable](#) .

i Note

In the industry component [Insurance](#) , you can decide whether accounting is to be managed on an account or open item basis.

Use

Alternative correspondence recipient

You can define an alternative correspondence recipient in the contract account (see [Recipient and Sender Determination](#)).

You do not have to activate contract account changes to have immediate effect, but rather you can enter a date as from which the changes should become effective. This data is not written to the database but recorded in change documents. The planned changes function only applies to changes to the contract account. You cannot schedule the creation of a contract account.

To activate this data, you should run program **BUSPCDACT** on a daily basis. This writes the scheduling to the database. You can use the application object **FICA** to activate planned changes to the contract account.

When you are in display mode for change documents, you can delete inconsistent data, for example, data that arises when planned changes are cancelled.

Check digits in the contract account

When you create a contract account, you can add a check digit to the contract account number. The prerequisites are as follows:

- You add the check digit procedure using event 1051. (Sample function module FKK_SAMPLE_1051_2_CHECKDIGITS for two check digits is supplied by SAP)
- The contract account is created with internal number assignment.
- Only procedures with one or two check digits are supported. The number range is configured such that it begins with a leading zero (check digit procedure with one check digit) or with two leading zeros (procedure with two check digits).

Contract account enhancements

You can make enhancements using the [Business Data Toolset \(BDT\)](#) in the menu for transaction CAWM.

Structure

Every contract account master record consists of general data that is the same for all business partners assigned to the contract account and business partner-specific data that can be set differently for each business partner in the contract account.

i Note

In the industry component [Insurance](#) , you can also define this data for the insurance relationship.

The master data is structured according to the processes that depend on the contract account data, such as incoming and outgoing payments, correspondence, dunning.

Integration

All transactions relating to contract accounts access data from the contract account master record (such as payments and dunning). Several transactions change data in the contract account master record (such as payment locks for returns).

Controlling Specifications in Contract Accounts

Use

In Contract Accounts Receivable and Payable, you enter data and parameters that control processing processes. Examples of this data include general data, data for payments and taxes, and data for dunning and correspondence.

The control options available include those mentioned below.

Tab: Group Box	You can specify:
General Data Cross-Partner Data	The key under which the contract account is managed in the SAP system and under which it may have been managed in a previous system
General Data Account Management Data	• Whether this business partner is an affiliated company, by specifying the unique key for the trading partner • That the account is flagged for deletion If there is no dependent data, the account is deleted when the archiving program is run. • What role a business partner has for the contract account (account relationship), when multiple business partners are assigned to the contract account You can only assign one business partner as the owner of the account. • Which authorization group that a contract account belongs to, so that it can only be edited by people with the corresponding authorization • That postings can no longer be made with reference to business-partner-related data (posting lock at the level of the contract account) In this way, you can specify that no documents can be entered, cleared, reversed, or reset. You can also choose between a posting lock and a clearing lock. If you have set a lock, the open items of a locked contract account are designated with an icon and cannot be set to active. • That all items posted to the account receive a clearing restriction This has the effect that these items can only be cleared by specific business transactions (for example, year-end settlement in a utilities company) • The tolerance limits that apply to outstanding payments • The underlying clearing category for clearing postings • The planning group that the business partner belongs to and how many additional days are taken into consideration before an open item is paid (cash management) • That an interest key applies at contract account level This is used in interest calculations to determine interest frequency, amount limits and transfer and tolerance days as long as no other interest key has been defined at a more specific level.

	• Which collective invoice account is used by this contract account together with other contract accounts • The tax jurisdiction valid for calculation of tax (U.S./Canada) • That no invoice is created as a result of specifying a lock reason for a master data record
General DataContract Account: Remarks	Remarks about the contract account in various languages
Payments/Taxes: Incoming Payments and Payments/Taxes: Outgoing Payments	• That payments are processed using an alternative payer or alternative payee • The payment method that is to apply • Which bank details are used for incoming and outgoing payments • Which card ID is valid for incoming and outgoing payments • Which mandate applies for incoming payments • The reason for locking the contract account for incoming or outgoing payments Several limited-time locks are possible.
Payments/Taxes: Taxes	• That the withholding tax code is set for incoming and outgoing payments in the relevant country That several characteristics are defined for each tax code, such as the tax rate • The number and validity period of the certificate issued for exemption from withholding tax. • For which country a service was provided You only have to change the default value here if it differs from the country key of the business partner's standard address. • The tax criteria for sorting companies • The regional code for automatic address preparation • The county code for classifying different locations from a tax point of view
Dunning/Correspondence: Dunning Control	• That the dunning notices are sent to an alternative dunning recipient but that the actual business partner can also receive dunning notices • The grouping category to which the contract account's overdue items are assigned when executing the dunning run

	Several limited-time locks are possible.
Convergent Invoicing: Basic Data	• The invoicing category for finer control of billing and invoicing processes • The selection characteristic in scheduling that is used for contract-account-dependent derivation of rating, billing and invoicing dates • That no invoice is created or processing is blocked as a result of specifying a lock reason for a master data record • The target currency for posting of amounts in invoicing • That a key is entered for determining forms at the contract account level This key is used in determining an alternative application form.
Convergent Invoicing: Periodic Bills	When the system generates periodic bills
Convergent Invoicing: Individual Charges/Discounts	The individual charges and discounts you calculate for the business partner

In addition, industry-specific fields are also available.

Link: Contract Account - Business Partner

Use

At least one business partner is assigned to each contract account. Depending on the industry sector, assignment of several business partners to a contract account is also allowed.

Prerequisites

Additional business partners can only be assigned to a contract account if the corresponding contract account category allows this.

Features

The master data for a contract account is divided into a part that is the same for all business partners of the contract account (that is, independent of the business partner) and a part that is business-partner-specific. The business partner-specific data can be controlled differently for different business partners.

Activities

In Customizing for Contract Accounts Receivable and Payable under **Basic Functions > Contract Accounts > Contract Account Relationships > Define Contract Account/Business Partner Relationships**, you define contract account relationships.

❖ Example

For automatic payment clearing, you specify that a payment on account is always assigned to the account holder.

Logging of Changes to Contract Account

Use

Changes to fields of the contract account are logged. The changes can be displayed in the dialog maintenance of the contract account. It also contains information about who created a contract account when, and who made the last change.

Key Features

In the menu, choose the transaction **Extras** and then choose the desired menu entry in the following table.

Menu Entry	The system displays the following:
Creation Data	Who created a contract account when and last changed it There is a difference here between general and business-partner-specific data.
Account Changes	All the changes to an account. During execution, the system offers a selection list of all fields that have previously been changed on the account. In addition, the system displays cross-business-partner and business-partner-specific details regarding the creation data of the account, and additional data on business partners. By selecting individual fields, you can select the change data. After confirming the entries, a list of all the changes appears, specifying the person who made them and the date of the change.
Field Changes	Changes to the field on which the cursor is positioned. After choosing this function, a list with the changes made to this field appears, specifying the person who made them and the date of the change.

No change documents are written for process locks. You can display the history for the display locks from the dialog for the locks

Automatic Master Data Transfer

Use

You use this function to transfer the contract account master data from legacy or operational systems.

Features

1. The relevant data is read from the operational system and placed in a sequential file (operational system sender structure) by the data selection program. This transaction takes place outside of the SAP system and is not supported by SAP programs. Therefore the data selection program can make changes to data at this point.
2. The SAP transfer program reads the data from the sender structure, changes the data, and places the data in the receiver structure. Data can be changed or converted in this last step.

Activities

For more information, and the programs involved, see the Implementation Guide for Contract Accounts Receivable and Payable: ► [BasicFunctions](#) ► [ContractAccounts](#) ► [DataTransfer](#) ►.

Creating, Changing, and Displaying Contract Accounts

Use

You can create or change contract accounts both online and from the operational system (see [Transferring Master Data Automatically](#)).

Only one business partner's data is ever displayed. For information on editing or displaying another business partner's data see [Displaying or Editing Other Business Partners](#) .

Features

If you want to change or display a contract account, you can enter the contract account number or the business partner.

The business partner is determined automatically if only one business partner has been assigned to the contract account.

If more than one business partner has been assigned to the contract account, then a dialog box in which you can choose a partner to be edited appears.

If several contract accounts were assigned to a business partner, a dialog box appears showing all the contract accounts assigned to that business partner. You can select a contract account from the dialog box and display it for processing.

Using authorization object F_KK_FCODE, you can issue authorizations for master data dialogs. You can determine, for example, which user is no longer authorized to assign partners to a contract account. See the authorization documentation for further information.

You can make changes to a contract account and have them take effect from a time in the future. The changes are not saved directly to the database, they are entered in change documents. To activate the data, you have to run report BUSPCDACT for the application object FICA(see SAP menu ► [Master Data](#) ► [Contract Account](#) ►). For more information, see the report documentation.

Creating Contract Accounts

Prerequisites

To create a contract account, you must have created a business partner to whom you assign this contract account. You can assign

In addition, in the system, a contract account category must have been maintained that you assigned to the contract account when you created it.

Procedure

1. ► **Select one of the following paths:** ► ► ► **Roles** ► ► **Edit contract account master data** ► **(SAP_FI_CA_CONTRACT_ACCOUNT)** ► **Create contract account** ► ► **SAP Menu** ► ► **Master data** ► **Contract account** ► **Create** ►
2. The initial screen appears.
3. Enter the following data:
 - A business partner who is assigned to the account. At least one partner must be assigned to each account.
 - A contract account category (see [Contract Account Category](#)).
 - You can either assign a contract account number yourself or have the system assign the number.
1. Choose **Continue** .
2. The first data entry screen appears.
3. Enter the required data. Using the navigation buttons, you can navigate between the various data screens.
4. Save the contract account.

Result

You have created the contract account and made all business partner assignments.

Assigning Additional Business Partners

Prerequisites

The contract account category allows you to assign multiple business partners to a contract account. You have already assigned a business partner to the contract account.

Procedure

1. On the SAP Easy Access screen, choose ► **Master Data** ► **Contract Account** ► **Change** ► (CAA2) and enter the required contract account.
2. The first screen for data entry appears.
3. Choose ► **Goto** ► **New Partner** ► to jump to a dialog box in which you can assign an additional business partner to the account.

After you execute the function, all fields that contain business partner-specific data appear initial (or with their default values) and the general data remains unchanged.

Prerequisites

Several business partners must be assigned to the contract account.

Procedure

You can use the **OtherPartner** function to switch between the data of individual partners in the contract account.

1. On the SAP Easy Access screen, choose **Master Data > Contract Account > Display** (CAA3).
Enter the required contract account.
2. Then choose **Goto > Other > Partner**.
3. The system displays a selection window for the business partners already assigned to the contract account.
4. Choose a business partner.

The data for this business partner is displayed and can be processed.

Selecting Addresses for Business Partners

Prerequisites

You have defined multiple addresses for a business partner want to use each of these addresses for a specific purpose (for example, for dunning notices).

Procedure

1. In the **Create Contract Account / Change Contract Account** (CAA1/CAA2) transactions, on the **General Data**, **Payments / Taxes**, or **Dunning / Correspondence** tab pages, call the input help for the **Address Description** field.
A selection window appears with the business partner addresses maintained in the master record.
2. Choose the required address, for example, that you want to send a dunning notice to, by double-clicking it.

Result

The selected address is transferred. In the contract account master record, the **Fixed** indicator next to the address field is now selected. It indicates that a specific address was selected and not the standard address of the business partner.

i Note

You can use this function to select the address for each business partner in the contract account, regardless of whether this is the owner of the contract account to be created or changed, or an alternative business partner (such as the dunning recipient).

If you do not select an address, the default address of the contract account holder is used automatically for all business transactions.

In the contract account master record, there is one process lock field for dunning, posting, invoicing, correspondence dunning, interest calculation, incoming payments, and outgoing payments respectively. You enter a lock reason in this field if you want to lock an account. You can set the lock for a limited period or set multiple locks for each business transaction.

Prerequisites

You have maintained the lock reasons for dunning and payment in Customizing for Contract Accounts Receivable and Payable.

Procedure

1. Call up the contract account you want to change or display.
2. Enter a lock reason in the **Lock On** field on the **Change Contract Account: Dunning/Correspondence Data** screen for dunning control, incoming or outgoing payments.
3. If you want to set a lock for a limited period or if you want to set or display multiple locks, press the arrow key next to the **Lock** field.

A dialog box appears where you can display or enter the lock interval or the lock itself. You can also display the lock history from this dialog box. Changes related to the locks are written in the lock history and are not logged with change documents.

You can change and delete locks in this dialog box.

Note the following:

- If you only specify one lock reason, the lock will be for an unlimited period of time.
- If you only enter one lock reason, you can change or delete this. If multiple or limited-time locks have been set, press the arrow key to make changes. You can then make changes in the dialog box that appears.
- If you have set multiple or limited-time locks, the **Lock** field contains a ~ . In this case, choose the arrow key to display the locks.

Result

The contract account is locked for the business transaction selected either for a limited or unlimited amount of time, depending on the lock reason.

Manage Contract Accounts

The **Manage Contract Accounts** (F5474) app provides a central entry point for contract account maintenance.

Key Features

You can use this app to do the following:

- Display a list of contract accounts

Filter the list according to your needs, for example, by business partner and company code

To change a contract account, select the desired contract account in the list and press **Change**. This takes you to the app for changing contract accounts.

- Create contract accounts

To create a new contract account, press **Create**. This takes you to the app for creating contract accounts.

i Note

From the **Manage Contract Accounts** app, you can access the following transactions:

- **Create Contract Account** (transaction **CAA1**)
- **Change Contract Account** (transaction **CAA2**)
- **Display Contract Account** (transaction **CAA3**)

Implementation Information

In the SAP Fiori Apps Reference Library, see the details for the [Manage Contract Accounts](#) app.

Related Information

[Creating, Changing, and Displaying Contract Accounts](#)

Correspondence for Master Data Changes

Use

Using correspondence type 0030 (master data change), you can follow immediate and planned changes to the master data of your business partners (business partner, contract account, contract reference).

Prerequisites

In the Implementation Guide for **Contract Accounts Receivable and Payable**, under **Basic FunctionsCorrespondenceDefine Fields for Creating Master Data Changes**, you have entered the tables to be considered for the correspondence (for example, BUT000 – general business partner data). You can only define tables that contain object classes defined by SAP, since the key for selecting the change documents is different for each object class and is created in module FKK_SAMPLE_1915. If you want other tables and therefore object classes to be considered, a program enhancement is necessary. The object classes defined by SAP are delivered in system table TFK070QC, which contains the following entries: ADRESSE, ADRESSE2, BUPA_BUP, FMCA_PSOB, FMCA_PSOBVKK, MKK_VKONT. When you enter a table in Customizing, the system automatically checks whether your entry is valid. Use the input help to display the valid entries. Once you have entered the tables, in a second step, you define the fields to be monitored for each table (for example, STREET in table ADRC). If the system writes a change document for a field that you have defined here in Customizing, this field is displayed in the correspondence. To determine which tables and fields you have to enter in Customizing, proceed as follows:

In the menu, choose **Display Business Partner** or **Change Business Partner**.

Enter a business partner, specify the screen selection, and choose **Continue**.

Choose **Continue** . A list of the change documents previously created appears.

The same procedure applies for the transactions **Display Contract Account** and **Change Contract Account**. In the menu of the detail screen, choose **Extras** → **Account Changes**

Features

You have to trigger the creation of the correspondence manually. The program selects all change documents created for the business partner on the same day and then creates an individual correspondence. Only the change documents for the fields defined in Customizing are considered in the correspondence. This means that the user can decide which master data changes he wants to follow and inform the customer about. Only actual changes to existing data and changes made on the current date are considered. This means that new master data, such as business partners and addresses, are not taken into account in the correspondence. You cannot list or individually select the selected changes for the correspondence before the correspondence is created. For correspondence type 0030 you can use events 1914 (print event) and 1915 (creation event). Read the documentation for function modules FKK_SAMPLE_1914 and FKK_SAMPLE_1915. You can determine industry-specific additional data for the contract reference with a module for event 1916 (FKK_SAMPLE_1916). The module FMCA_SAMPLE_1916 is defined for determining data for the contract object for the industry solution **Contract Accounts Receivable and Payable for Public Sector** . FI_CA_MASTERDATA is defined as the standard form class in Customizing. At the top level (document level), the form class contains a 1:1 level to the business partner. The hierarchy below contains the level for the change documents, whereby the process logic determines that first the change documents and then the planned change documents are listed (see application form example FI_CA_MASTERDATA_SAMPLE). In the application form, you can display the old and the new value for a changed field. Note that certain fields only contain IDs (table keys), that is, links to the actual data (for example, bank details ID for incoming payments). The determination of details for these IDs and other ID fields is not supported in the standard. However, you can implement this in the customer-specific application form.

Activities

In the menu of the transactions **Change Business Partner**, **Display Business Partner**, **Change Contract Account** , and **Display Contract Account** , choose **ExtrasAdditional ExtrasCorrespondence**

On the processing screen that appears, make selections for the business partner, contract account, and contract reference and make specifications for printing. You must specify a business partner. If you do not make any restrictions for the contract account and/or contract reference, changes to all contract accounts and contracts (contract references) of this business partner are considered, instead of only changes to the selected objects.

Confirm your entries.

The correspondence is created.

Example

Example 1

A customer informs you that she has recently married and informs you of her new last name. She requests written confirmation that her data has been changed. Once the clerk has entered the new name in the field **Last Name** (BUT000-NAME_LAST) in the transaction **Change Business Partner** , he creates a correspondence that documents the change made and sends it to the customer.

Example 2

Account and schedules the change for the date specified. Using the correspondence for master data changes he informs the tenant about the change planned in the system.

Contract Account and Contract Special Features for IS-U

This documentation section contains information about enhancements and variations from the FI-CA contract account and contract, which apply specifically to SAP Utilities (IS-U).

Contracts (IS-U)

Definition

Contracts in IS-U.

Use

Contracts represent the entities that are billed. You can bill one or more contracts together using a contract account.

Structure

You can divide the data from contracts into three categories:

- General data
- Data relevant to billing (business)
- Data regarding move-in and move-out.

Integration

Contracts are linked to installations in IS-U; these installations contain technical data with regard to billing. In the case of a move-out, the installation remains and the contract is ended. In the case of the next move-in, a new contract is created and linked to the installation. Only one contract can ever be assigned to an installation at any one time.

Controlling Specifications in Contract Accounts (IS-U)

Use

There are a number of attributes in the contract account that are specific to IS-U. These can be divided into various areas:

General data, such as:

- Indicator for additional bill
- Transaction currency
- Terms of payment
- Account class

- Application form
- Language

Dunning control:

- Indicator for additional dunning notice

Payment control, such as:

- Automatic debit procedure
- Number of automatic debits performed
- Number of returned automatic debits
- Indicator for recurring entry request
- No payment form indicator

Features

Several business partners can be assigned to the contract account. There is always just one account holder. You cannot post to the other business partners.

The Business Object Repository (BOR) contains the following Business Application Programming Interface (BAPIs) for contract accounts:

- BAPI_ISUACCOUNT_CREATERFROMDATA (creating a contract account)
- BAPI_ISUACCOUNT_GETDETAIL (displaying a contract account)
- BAPI_ISUACCOUNT_GETLIST (displaying a list of contract accounts)

For more information about BAPIs, see the following:

- BAPIs in general: BAPI user guide and programming guidelines.
- BAPIs in detail: Associated documentation in the BOR

Link Between Contract Accounts and Contracts (IS-U)

Use

Several contracts are grouped together in a contract account. A selection of these contracts can be invoiced together. You can make sure that several of them are invoiced together using indicators in the contracts. Otherwise this remains optional, that is, contracts are only invoiced together if invoicing happens to take place at the same time.

Prerequisites

A contract must always be assigned to a contract account.

Use

You use this function to transfer contract account data from a legacy system to IS-U for the first time. It is available within the IS-U migration workbench.

Integration

You need the IS-U migration workbench to prepare and carry out the data transfer. To do this, go to the Customizing menu for SAP Utilities and select **►Tools► Migration► Establish settings for IS-U migration ►**.

Prerequisites

You must have transferred business partners in the IS-U migration workbench before transferring the contract accounts.

Migration Customizing for the contract accounts must have been maintained completely.

Features

You create the contract accounts from the legacy system's data using direct input.

Assigning Contracts to Contract Accounts (IS-U)

Procedure

Contracts are created in utilities when a move-in is entered (transaction EC50E). Contracts are automatically allocated to a contract account. You can either select an existing contract account or create a new one.

You can find more information in the section on [move-in](#).

Result

Once you have saved the move-in, the number of the allocated contract account is stored in the contract.

Loans (IS-U)

Use

Note that this function does not replace the standard loan management function in Treasury. This functions helps you manage **very simple** loans, such as a loan given to a customer if an appliance (a heat pump, for example) has to be bought. It is not possible to manage premiums or discount. The system only supports fixed interest rates for the whole term.

Integration

Before you can use the loan function, the system has to be set up to manage installment plans. The individual interest calculation function must be set up to enable you to calculate interest

You can manage both interest-free loans and loans with a fixed interest rate. A repayment plan is created for repayment of a loan. You can select the same due date lists as those for an installment plan. Each installment through to the last installment is of the same amount. The installment includes an interest and repayment component. As with an annuity loan, interest is calculated on the basis of the individual due dates of the installment. A small interest amount and a higher repayment amount are payable at every due date. Note that once you have created the loan, you are no longer able to change either the amount or the due date of the individual installments.

When you create a loan, you have to specify parameters required for creating an installment plan (such as due date lists) and other data such as net loan proceeds, interest rate etc. When creating a loan, you have to post a document with the net loan proceeds as well as a repayment plan for the loan. This document comprises two line items, one of which contains the net loan proceeds and the other a receivable in the same amount. If you have created a loan with interest, an interest document is also posted. Depending on the due date of the repayment plan, this interest document contains its own line item with the interest amount for the due date.

You can group important control parameters as default values in a loan category. You can create several loan categories so that you avoid having to manually enter fixed parameters for the most common loans over and over again. The parameters proposed by this loan category can be overwritten manually.

You can define an alternative recipient for the disbursement. You can also define an alternative contract account and if necessary, an alternative business partner. This would make sense if the disbursement were not being made to the customer who has been given the loan, but directly to the contract partner supplying the appliance or performing the service. The credit can also contain an explicit alternative payment method enforcing direct disbursement of the amount.

After you have created and saved the loan, a letter can be sent to the customer. This letter is managed in the same form class as an installment plan letter.

Settlement type 20D is used when distributing a payment between the source items in a loan plan (interest and repayment) in settlement control.
